

Data DataLogger™

Logger Simple & Scalable logging to ODBC compliant databases

The DataLogger is a plug-in component to KEPServerEX which simplifies installation as well as configuration of an ODBC data logging project. If you have a Database Source (DSN) defined prior to launching the DataLogger, you can have a logging configuration active in fewer than 10 clicks. DataLogger is ODBC-based and therefore can perform inserts to any Database Management System (DBMS) for which an ODBC driver exists.

Why use DataLogger? **Simple & Scalable**

Thousands of customers who've standardized on KEPServerEX for their OPC server and PLC connectivity needs can now seamlessly log any OPC item/tag from KEPServerEX to their favorite ODBC compliant database like Access, SQL, MySQL, Oracle...or any DBMS for which an ODBC driver exists. DataLogger grows with your application needs with its multi-threaded support of concurrent logging processes. Log tens of thousands of points simultaneously *without* exceeding DataLogger's performance capacity!

Configuration Features:

- User-friendly installation, configuration, and project commissioning
- Flexible Tag creation: Drag & Drop and Dynamic Tag definition/logging
- Wizard-driven Trigger definitions with powerful Expression Triggers
- Trigger data logging according to Data Change, Time and/or Expressions
- Includes Simulator driver and *free* multi-use 2-hour demo for evaluation

Runtime Performance:

- Scalability through support of multiple concurrent logging processes (threads)
- Automatic Table Creation for most common databases
- Supports ability to append data to existing tables
- Error Recovery: Auto reconnect if a DSN connection is lost
- _System Tags allow for optional Runtime Control from OPC clients
